Michael Mehmet

Senior Software Engineer

micmehmet.com

I build robust solutions to hard problems. The tools and systems I bring can be used, understood, and trusted by anyone.

KNOWLEDGE COMPOUNDS

All the knowledge and experience I bring was forged over time – and is part of the package. Across these roles, I learned, introduced, and refined the practices, tools, architectures, and ways of working that I still draw on today:

Automed Systems

What began as a one-year contract became three years as the company kept finding more problems for me to solve. I delivered mobile apps, payment solutions, third-party platform integrations, introduced better engineering tools and practices, and even built a real-time AI voice receptionist and chatbot API from the ground up. Their products, the systems they use, and the way they build software now are all in a better place than when I found them.

Tall Bob

I helped move a fast-growing startup toward more mature engineering practices, introducing better testing, documentation, CI/CD, observability, and more scalable architecture. I rebuilt the public API and documentation from scratch, introduced new approaches to integrations and search, and gained first-hand experience with formal disaster-recovery exercises. The API remains in use today, and Automed later migrated to Tall Bob in a move I actually helped broker.

EonX

This was where I developed much of the cloud, integration and platform knowledge I still rely on day to day. I worked across core products and API-driven engagement systems, later taking ownership of a bespoke platform for a major corporate partnership. When I arrived I was relatively new to technologies such as AWS and the wider backend stack in use, but after managing cloud infrastructure, deployment pipelines, authentication, observability and complex third-party integrations, I was fluent in them by the time I left.

Banxa

A strong example of disciplined software delivery: proper Business Analysis, structured Agile workflows, a dedicated QA team, clear documentation and handling of features, fixes, and releases. The work itself mattered, but the engineering culture and attention to detail left the bigger impression.

Zib Digital

An early foundation in fintech and payment systems, where I led the team building Zibit – a bill-sharing/payment platform created before PayID. I owned the backend and Android app, while gaining hands-on experience with bank integrations, ABA file processing, payment gateways, and complex credit-card surcharge logic. That knowledge and experience, along with familiarity with tools like Slack, continue to inform and influence how I work today.

FOUNDATION

The technical foundation that my work is built upon comes out of years of building, tinkering, and learning new things all the time. That means whatever it is you're building, I've probably already made something like it before. Sometimes because I needed something that didn't exist, sometimes because I wanted to understand how something works, and sometimes because the idea simply seemed worth pursuing.

What began as a practical need for an accounting system I could access from anywhere led to creating eLedger. Wanting to better understand how large language models work led me to Andrej Karpathy's excellent online explanations and tutorials, which gave me the grounding to build micGPT. I like backgammon but all the free apps I found were ad-heavy bloatware and I didn't think such a simple game needed to be. Building my own seemed like a good way to sharpen my skills while picking up some new mobile and AI engineering knowledge along the way.

MA – Cognitive Science **University of New South Wales**
BSc – Science & Mathematics **University of New South Wales**
